

What the invention claimed is:

1. A movement for disk player comprising:

a disk read head;

a read head moving mechanism;

5 a disk driving motor;

a ferrite substrate for disk driving motor; and

at least one driving motor control circuit disposed outside said ferrite substrate.

10 2. The movement for disk player as claimed in claim 1, wherein said moving mechanism comprising a driving source, a first gear coupled to said driving source, a first rail and a second rail, a rack mounted on said first rail, and a second gear meshed between said first gear and said rack.

15 3. The movement for disk player as claimed in claim 1, further comprising a signal bus line connected between said ferrite substrate and said disk driving motor.

4. The movement for disk player as claimed in claim 2, wherein said driving source of said moving mechanism is a motor.

20 5. The movement for disk player as claimed in claim 1, wherein said control circuit is made in a form of a printed circuit board.
